SE 1 Assignment

Given the shared JSON file, read it using a python script and convert it to CSV files as described below

> https://s3-us-west-2.amazonaws.com/secure.notion-static.com/3b29a068-2177-49c2-ab83-9b87fa7c7649/build.json

The first CSV file should contain the following columns:

Field Name
label
count

The second CSV file should contain the following columns:

Field Name
label
attribute_name
attribute_value
attribute_count

To accomplish this, the python script should first load the JSON file into memory. Then, it should iterate over each item in the JSON file and extract the relevant information for the two CSV files. Once the information has been extracted, the script should write it to the appropriate CSV file. Finally, the script should print a message indicating that the CSV files have been created successfully.
